

CS21 Decidability and Tractability

Lecture 6
January 16, 2015

January 15, 2014

CS21 Lecture 6

1

Outline

- Context-Free Grammars and Languages
 - parse trees
 - ambiguity
 - normal form
- equivalence of NPDAs and CFGs
- non context-free languages

January 15, 2014

CS21 Lecture 6

2

Context-Free Grammars

January 15, 2014

CS21 Lecture 6

3

CFG example

- Arithmetic expressions over $\{+, *, (,), a\}$
 - $(a + a) * a$
 - $a * a + a + a + a + a$
- A CFG generating this language:
 - $\langle \text{expr} \rangle \rightarrow \langle \text{expr} \rangle * \langle \text{expr} \rangle$
 - $\langle \text{expr} \rangle \rightarrow \langle \text{expr} \rangle + \langle \text{expr} \rangle$
 - $\langle \text{expr} \rangle \rightarrow (\langle \text{expr} \rangle) \mid a$

January 15, 2014

CS21 Lecture 6

4

CFG example

```
<expr> -> <expr> * <expr>
<expr> -> <expr> + <expr>
<expr> -> (<expr>) | a
```

- A derivation of the string: $a+a*a$
 - $\langle \text{expr} \rangle \Rightarrow \langle \text{expr} \rangle * \langle \text{expr} \rangle$
 - $\Rightarrow \langle \text{expr} \rangle + \langle \text{expr} \rangle * \langle \text{expr} \rangle$
 - $\Rightarrow a + \langle \text{expr} \rangle * \langle \text{expr} \rangle$
 - $\Rightarrow a + a * \langle \text{expr} \rangle$
 - $\Rightarrow a + a * a$

January 15, 2014

CS21 Lecture 6

5

Parse Trees

- Easier way to picture derivation: **parse tree**

- grammar encodes grouping information; this is captured in the parse tree.

January 15, 2014

CS21 Lecture 6

6

CFGs and parse trees

```
<expr> → <expr> * <expr>
<expr> → <expr> + <expr>
<expr> → (<expr>) | a
```

- Is this a good grammar for arithmetic expressions?
 - can group wrong way (+ precedence over *)
 - can also group correct way (**ambiguous**)

January 15, 2014

CS21 Lecture 6

7

Solution to first problem

```
<expr> → <expr> + <term> | <term>
<term> → <term> * <factor> | <factor>
<factor> → <term> * <factor>
<factor> → (<expr>) | a
```

- forces correct precedence in parse tree grouping
 - within parentheses, * cannot occur as ancestor of + in the parse tree.

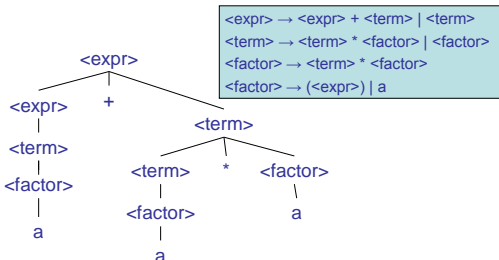

January 15, 2014

CS21 Lecture 6

8

Parse Trees

- parse tree for **a + a * a** in new grammar:

January 15, 2014

CS21 Lecture 6

9

Ambiguity

- Second problem: **ambiguous grammar**
- Definitions:
 - a string is **derived ambiguously** if it has two **different** parse trees
 - a grammar is **ambiguous** if its language contains an ambiguously derived string
- ambiguity sometimes undesirable
- some CFLs are **inherently ambiguous**

January 15, 2014

CS21 Lecture 6

10

Ambiguity

- Definition in terms of derivations (rather than parse trees):
 - order in which we replace terminals in shouldn't matter (often several orders possible)
 - define **leftmost derivation** to be one in which the leftmost non-terminal is always the one replaced
 - a string is ambiguously derived if it has 2 leftmost derivations

January 15, 2014

CS21 Lecture 6

11

Chomsky Normal Form

- Useful to deal only with CFGs in a simple **normal form**
- Most common: **Chomsky Normal Form (CNF)**
- Definition: every production has form

$$A \rightarrow BC \quad \text{or} \quad S \rightarrow \epsilon \quad \text{or} \quad A \rightarrow a$$
 where **A, B, C** are any non-terminals (and **B, C** are not **S**) and **a** is any terminal.

January 15, 2014

CS21 Lecture 6

12

Chomsky Normal Form

Theorem: Every CFL is generated by a CFG in Chomsky Normal Form.

Proof: Transform any CFG into an equivalent CFG in CNF. Four steps:

- add a new start symbol
- remove “ ϵ -productions” $A \rightarrow \epsilon$
- eliminate “unit productions” $A \rightarrow B$
- convert remaining rules into proper form

January 15, 2014

CS21 Lecture 6

13

Chomsky Normal Form

- add a new start symbol
 - add production $S_0 \rightarrow S$
- remove “ ϵ -productions” $A \rightarrow \epsilon$
 - for each production with A on rhs, add production with A's removed: e.g. for each rule $R \rightarrow uAv$, add $R \rightarrow uv$
- eliminate “unit productions” $A \rightarrow B$
 - for each production with B on lhs: $B \rightarrow u$, add rule $A \rightarrow u$

January 15, 2014

CS21 Lecture 6

14

Chomsky Normal Form

- convert remaining rules into proper form
 - replace production of form:

$$A \rightarrow u_1 u_2 u_3 \dots u_k$$

with:

$$\begin{array}{ll} A \rightarrow u_1 A_1 & U_1 \rightarrow u_1 \\ A_1 \rightarrow u_2 A_2 & \\ A_2 \rightarrow u_3 A_3 & U_3 \rightarrow u_3 \\ \vdots & \\ A_{k-2} \rightarrow u_{k-1} U_k & U_{k-1} \rightarrow u_{k-1} \quad U_k \rightarrow u_k \end{array}$$

U_2 already a non-terminal

January 15, 2014

CS21 Lecture 6

15

Some facts about CFLs

- CFLs are closed under
 - union (proof?)
 - concatenation (proof?)
 - star (proof?)
- Every regular language is a CFL
 - proof?

January 15, 2014

CS21 Lecture 6

16

NPDA, CFG equivalence

Theorem: a language L is recognized by a NPDA iff L is described by a CFG.

Must prove *two* directions:

- (\Rightarrow) L is recognized by a NPDA *implies* L is described by a CFG.
- (\Leftarrow) L is described by a CFG *implies* L is recognized by a NPDA.

January 15, 2014

CS21 Lecture 6

17

NPDA, CFG equivalence

Proof of (\Leftarrow) : L is described by a CFG *implies* L is recognized by a NPDA.

January 15, 2014

CS21 Lecture 6

18

NPDA, CFG equivalence

1. we'd like to non-deterministically guess the derivation, forming it on the stack
2. then scan the input, popping matching symbol off the stack at each step
3. accept if we get to the bottom of the stack at the end of the input.

what is wrong with this approach?

January 15, 2014

CS21 Lecture 6

19

NPDA, CFG equivalence

- only have access to top of stack
- combine steps 1 and 2:
 - allow to match stack **terminals** with tape *during* the process of producing the derivation on the stack

January 15, 2014

CS21 Lecture 6

20

NPDA, CFG equivalence

- informal description of construction:
 - place \$ and start symbol S on the stack
 - repeat:
 - if the top of the stack is a **non-terminal** A, pick a production with A on the lhs and substitute the rhs for A on the stack
 - if the top of the stack is a **terminal** b, read b from the tape, and pop b from the stack.
 - if the top of the stack is \$, enter the accept state.

January 15, 2014

CS21 Lecture 6

21

NPDA, CFG equivalence

January 15, 2014

CS21 Lecture 6

22

NPDA, CFG equivalence

Proof of (\Rightarrow): L is recognized by a NPDA
implies L is described by a CFG.

- harder direction
- first step: convert NPDA into “normal form”:
 - single accept state
 - empties stack before accepting
 - each transition *either pushes or pops* a symbol

January 15, 2014

CS21 Lecture 6

23

NPDA, CFG equivalence

- **main idea:** **non-terminal** $A_{p,q}$ generates exactly the strings that take the NPDA from state p (w/ empty stack) to state q (w/ empty stack)
- then $A_{start, accept}$ generates all of the strings in the language recognized by the NPDA.

January 15, 2014

CS21 Lecture 6

24

NPDA, CFG equivalence

- Two possibilities to get from state p to q :

January 15, 2014

CS21 Lecture 6

25

NPDA, CFG equivalence

- NPDA $P = (Q, \Sigma, \Gamma, \delta, \text{start}, \{\text{accept}\})$
- CFG G :
 - non-terminals $V = \{A_{p,q} : p, q \in Q\}$
 - start variable $A_{\text{start}, \text{accept}}$
 - productions:
 - for every $p, r, q \in Q$, add the rule

$$A_{p,q} \rightarrow A_{p,r}A_{r,q}$$

January 15, 2014

CS21 Lecture 6

26

NPDA, CFG equivalence

- Two possibilities to get from state p to q :

January 15, 2014

CS21 Lecture 6

27

NPDA, CFG equivalence

- NPDA $P = (Q, \Sigma, \Gamma, \delta, \text{start}, \{\text{accept}\})$
- CFG G :
 - non-terminals $V = \{A_{p,q} : p, q \in Q\}$
 - start variable $A_{\text{start}, \text{accept}}$
 - productions:
 - for every $p, r, s, q \in Q$, $d \in \Gamma$, and $a, b \in (\Sigma \cup \{\epsilon\})$
 - if $(r, d) \in \delta(p, a, \epsilon)$, and
 - $(q, \epsilon) \in \delta(s, b, d)$, add the rule

$$A_{p,q} \rightarrow aA_{r,s}b$$

January 15, 2014

CS21 Lecture 6

28

NPDA, CFG equivalence

- NPDA $P = (Q, \Sigma, \Gamma, \delta, \text{start}, \{\text{accept}\})$
- CFG G :
 - non-terminals $V = \{A_{p,q} : p, q \in Q\}$
 - start variable $A_{\text{start}, \text{accept}}$
 - productions:
 - for every $p \in Q$, add the rule

$$A_{p,p} \rightarrow \epsilon$$
